Correct use

The correct use of AI in college is that it is used as a supplement to learning and not a replacement. AI can be used to help better learning through explaining difficult concepts or helping making study sets but should never be used to complete assignments. AI is a useful tool to help students with studying and gaining a deeper understanding. This is not possible if students simply copy prompts into AI platforms and do not understand how to do the work themselves. AI is a powerful tool to help college students if used correctly. All AI usage in college should be clarified with the professor on specific policies and proper usage, if allowed.

ChatGPT response

Yes, I agree with your argument. I think you make a strong point that AI should be used as a tool to support learning, notas a substitute for learning.

AI can be beneficial in college when students use it to explain difficult concepts, create practice questions, organize studymaterials, or receive feedback on their understanding. These uses encou rage students to engage with the material anddevelop their knowledge. However, when students r ely on AI to complete assignments without understanding the work,they miss valuable learning o pportunities and may struggle to apply those skills independently.

I also agree with your point about clarifying AI usage with professors. Different courses and instr uctors may havedifferent policies regarding AI, so students should understand what is permitted before using it for coursework.

One additional point I would make is that using AI to help with an assignment is not always the s ame as having AIcomplete the assignment. For example, asking AI to explain a mathematical co ncept before solving a problemindependently can be a productive learning strategy. Asking AI to solve the problem and submitting the answer withoutunderstanding it is a different matter.

Overall, your argument promotes a balanced approach to AI in higher education. Rather than avo iding AI entirely orrelying on it for everything, students should use it responsibly to strengthen th eir critical thinking, independence, andunderstanding.

My only suggestion: If you're writing this for a college assignment or discussion post, you could strengthen yourargument by briefly acknowledging that AI can also make mistakes or provide in accurate information. This reinforceswhy students need to think critically and verify what AI tell s them.

Incorrect use

The correct use of AI while in college is to use it as the default first step whenever students don’t know how to do something themselves or do not want to do it. It does not matter how or what AI is used on, it can be used for homework assignments, quizzes, or tests. When

using AI in college, students should copy and paste exactly what the AI engine says into assignments or tests. This is the correct use because it is taking advantage of the resources available to students and making the most of their time. The purpose of AI is to automate tasks and make people's lives easier, and this includes colleges students and their assignments, quizzes, and exams.

ChatGPT response

I partly agree with your argument. I agree that AI can be a valuable resource for college students because it saves time,explains difficult concepts, helps with studying, and makes certain tasks ea sier. Students should take advantage of thetechnology available to them, just as they would use c alculators, textbooks, or other learning resources.

However, I disagree with the idea that AI should always be the first step whenever students do n ot know how to dosomething or do not want to do it. Struggling with difficult material is often an important part of learning. If students relyon AI for every challenge, they may miss opportunitie s to develop problem-solving skills, critical thinking, andindependence.

I also disagree that students should always copy and paste AI responses directly into assignments , quizzes, or tests. Theimportant distinction is between using AI as a tool to support learning and using it to replace learning. For example, usingAI to explain a difficult concept or check your un derstanding can be beneficial. Submitting AI-
generated answers on anexam when AI use is prohibited, however, can violate academic integrit y policies.

Ultimately, I believe college students should be encouraged to use AI frequently and responsibly. If a professor allows AIon an assignment or exam, students should be able to take advantage of i t within the stated guidelines. The goal shouldnot be to avoid AI, but to use it in ways that save ti me while still helping students gain the knowledge and skills theyneed.

My overall position: AI should be a readily available resource for college students, but it should not automatically replacetheir own thinking, effort, or learning.
